Abstract

Education has a critical role in societal progress. A strong educational system produces good citizens. Countries that scrimp on education fall behind in the drive for progress. The advancement of ICT has resulted in major and positive advancements in the educational system, allowing knowledge to be accessed from anywhere. Numerous of people are unable to be present traditional the advantages of classes in the e-

learning system, which has been embraced by most modern civilizations. However, technology cannot be utilized to replace face-to-face communication learning. The combination of traditional education and eLearning is extremely beneficial, and many industrialized civilizations are reaping the benefits. COVID-19's rapid global expansion has recently brought the old educational system to a halt. Lockdown and seclusion have kept billions of children out of school. The majority of countries have declared school closures. Distance learning is the only way to keep the educational system moving in such a situation. The current eLearning infrastructure, on the other hand, was not prepared for such a quick change from traditional education to eLearning. The object of this chapter is to give focus to the higher and post-secondary education systems and to compare the results to determine which system is more effective. Further, every day, lots of new problems are reported, such as internet access, conducting evaluations, etc.
